

Reporting on Comala Workflows data

This use case involves an integration between Reporting and Comala Workflows. Both add-ons must be installed before proceeding.

Comala Workflows provides a workflow and approval process that serves many different organisations. Using Reporting, sophisticated reports can be built to access and review your Workflow data.

Understanding the Workflow Supplier

The [Workflow Supplier](#) created by Comalatech allows you to access Workflow data using Reporting. It is an extension of our existing set of [Suppliers](#).

The 3 main objects supplied by the Workflow Supplier are: **approvals**, **states** and **tasks**. Any page with an existing Workflow will contain these 3 objects. To access the Workflow data associated with each page or space, simply refer to the keys provided by the [Workflow Supplier](#).

Fetching data from Workflows

Accessing the Workflow data is the same as any other key. Just refer to the [Workflow Supplier](#) to figure out what you would like to report on.

If you are an existing Reporting user, then this should be easy

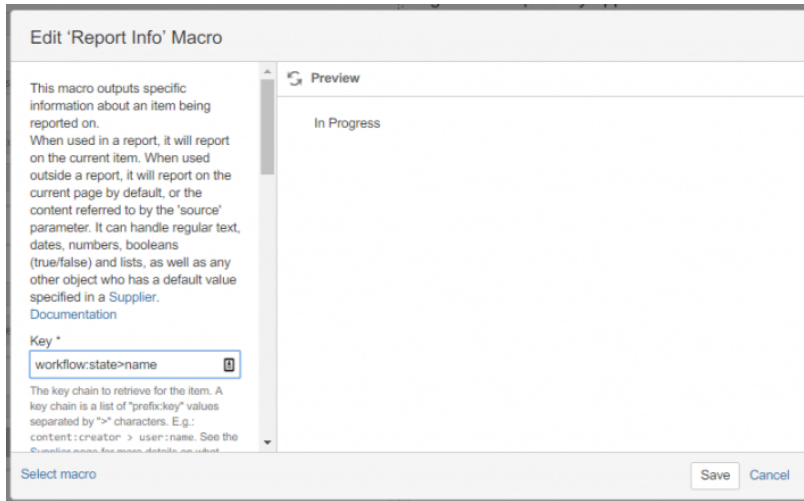

Example

Recipes

- All page states within a space
- All pages with the 'Approved' state in the last month
- Message banners for pages
- Pages that require approval
- Pages that require my approval
- Tasks assigned to me
- Tasks due in the next month
- Tasks in this space

Resources from Comalatech

- [ServiceRocket Reporting Integration](#)
- [Workflow Supplier](#)
- [workflow-reporter macro](#)

`workflow:state>name` returns the name of a page's state, this case it's 'In Progress'.

`workflow` is the **prefix**, and `state` is the **key**. `name` is the **chained key** of `state`.
